Appl. No. 10/696,215 Arndt. Dated April 10, 2006 Reply to Office Action of January 12, 2006

## AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the above-identified application:

Claim 1 (currently amended): A turbine blade proximity sensor system for sensing proximity of each of a plurality of rotating turbine blades to a non-rotating turbine component, comprising:

a sensor coil;

an oscillator circuit coupled to the sensor coil and operable to generate a variable frequency sensor signal and supply a the variable frequency sensor signal thereto, the variable frequency sensor signal generated by the oscillator circuit having a frequency that varies that is frequency modulated based on the proximity of the sensor coil to each of the turbine blades, whereby the variable frequency sensor signal is a frequency modulated sensor signal; and

a frequency modulation (FM) detector circuit adapted to receive the frequency modulated sensor signal and operable, in response thereto, to supply a proximity signal having an amplitude that varies with, and is representative of, the proximity of each of the turbine blades to the non-rotating turbine component.

Claim 2 (original): The proximity sensor system of Claim 1, further comprising:
display coupled to receive the proximity signal from the FM detector and
operable, in response thereto, to supply a visual display of the proximity of each of the
turbine blades to the turbine shroud.

Claim 3 (original): The proximity sensor of Claim 1, wherein the FM detector circuit comprises an FM demodulator.

Claim 4 (original): The proximity sensor of Claim 3, wherein the FM demodulator comprises a ratio detector.

Appl. No. 10/696,215

Amdt. Dated April 10, 2006

Reply to Office Action of January 12, 2006

Claim 5 (original): The proximity sensor of Claim 1, wherein:

the oscillator circuit is configured to wirelessly transmit the sensor signal; and the FM detector circuit is configured to wirelessly receive the transmitted sensor signal.

Claim 6 (original): The proximity sensor of Claim 1, wherein the oscillator circuit includes one or more capacitance circuit elements electrically coupled in parallel with the sensor coil.

Claim 7 (original): The proximity sensor of Claim 6, further comprising:

a coaxial cable coupled between the sensor coil and the oscillator circuit, the coaxial cable having a capacitance that acts as at least one of the capacitance circuit elements.

Claim 8 (original): The proximity sensor of Claim 1, further comprising:

a coaxial cable coupled between the sensor coil and the oscillator circuit, the coaxial cable having an effective capacitance that is electrically coupled in parallel with the sensor coil, to thereby form an LC circuit.

Claim 9 (original): The proximity sensor of Claim 1, wherein the sensor coil comprises:

a ceramic core; and

a conductor selected from the group consisting of platinum and molybdenum.

Claim 10 (original): The proximity sensor of Claim 1, further comprising:

a peak detector coupled to receive the proximity signal and operable, in response thereto, to determine a peak value of the proximity signal.

Claim 11 (currently amended): A turbine blade proximity control system for controlling proximity of each of a plurality of turbine blades to a non-rotating turbine component, comprising:

Appl. No. 10/696,215 Amdt. Dated April 10, 2006 Reply to Office Action of January 12, 2006

a sensor coil;

an oscillator circuit coupled to the sensor coil and operable to generate a variable frequency sensor signal and supply a the variable frequency sensor signal thereto, the variable frequency sensor signal generated by the oscillator circuit having a frequency that varies that is frequency modulated based on the proximity of the sensor coil to each of the turbine blades, whereby the variable frequency sensor signal is a frequency modulated sensor signal;

a frequency modulation (FM) detector adapted to receive the frequency modulated sensor signal and operable, in response thereto, to supply a proximity signal having an amplitude that varies with, and is representative of, the proximity of each of the turbine blades to the non-rotating turbine component; and

a controller coupled to receive the proximity signal from the FM detector and operable, in response thereto, to control the proximity of the turbine blades to the non-rotating turbine component.

Claim 12 (original): The system of Claim 11, wherein:

the non-rotating turbine component is either a turbine case or a component coupled to the turbine shroud; and

the controller controls the proximity of the turbine blades to the non-rotating turbine component by controlling turbine shroud temperature.

Claim 13 (original): The system of Claim 12, wherein the controller, in response to the proximity signal, supplies one or more valve control signals, and wherein the system further comprises:

one or more valves in fluid communication between a cooling air source and the turbine shroud, each valve having an actuator coupled to receive one or more of the valve control signals and operable, in response thereto, to selectively move its associated valve between an open position and a closed position, to thereby selectively cool the turbine case.

Appl. No. 10/696,215

Amdt. Dated April 10, 2006

Reply to Office Action of January 12, 2006

Claim 14 (original): The system of Claim 11, further comprising:

an display coupled to receive the proximity signal from the FM detector and operable, in response thereto, to supply a visual display of the proximity of each of the turbine blades to the turbine shroud.

Claim 15 (original): The system of Claim 11, wherein the oscillator circuit includes one or more capacitance circuit elements electrically coupled in parallel with the sensor coil.

Claim 16 (previously presented): The system of Claim 15, further comprising:

a coaxial cable coupled between the sensor coil and the oscillator circuit, the coaxial cable having a capacitance that acts as at least one of the capacitance circuit elements.

Claim 17 (original): The system of Claim 11, further comprising:

a coaxial cable coupled between the sensor coil and the oscillator circuit, the coaxial cable having an effective capacitance that is electrically coupled in parallel with the sensor coil, to thereby form an LC circuit.

Claim 18 (original): The system of Claim 11, wherein the sensor coil comprises:

a ceramic core; and

a conductor selected from the group consisting of platinum and molybdenum.

Claim 19 (original): The system of Claim 11, further comprising: a peak detector coupled to receive the proximity signal and operable, in response thereto, to determine a peak value of the proximity signal.

Claim 20 (currently amended): A gas turbine engine, comprising:

a turbine case:

a turbine wheel rotationally mounted within the turbine case;

Appl. No. 10/696,215 Amdt. Dated April 10, 2006 Reply to Office Action of January 12, 2006

a plurality of turbine blades extending from the turbine wheel toward the turbine case; and

a turbine blade proximity sensor system including:

a sensor coil disposed at least partially within the turbine case,
an oscillator circuit coupled to the sensor coil and operable to generate a
variable frequency sensor signal and supply a the variable frequency sensor signal
thereto, the variable frequency sensor signal generated by the oscillator circuit
having a frequency that varies that is frequency modulated based on the proximity
of the sensor coil to each of the turbine blades, whereby the variable frequency
sensor signal is a frequency modulated sensor signal, and

a frequency modulation (FM) detector circuit coupled to receive the frequency modulated sensor signal and operable, in response thereto, to supply a proximity signal having an amplitude that varies with, and is representative of, the proximity of each of the turbine blades to either the turbine case or one or more components mounted thereto.

Claim 21 (currently amended): A method of determining proximity of each of a plurality of turbine blades to a non-rotating turbine component, comprising the steps of:

generating and supplying a variable frequency sensor signal, the variable frequency sensor signal that is generated having a frequency that varies that is frequency modulated-based on the proximity of each of the turbine blades to the non-rotating turbine component, whereby the variable frequency sensor signal is a frequency modulated sensor signal;

demodulating the frequency modulated sensor signal, to thereby supply a proximity signal having an amplitude that varies with, and is representative of, the proximity of each of the turbine blades to the non-rotating turbine component.

Claim 22 (original): The method of Claim 21, further comprising the step of:
varying the proximity of each of the turbine blades to the non-rotating turbine
component in response to the proximity signal.

Appl. No. 10/696,215 Amdt. Dated April 10, 2006 Reply to Office Action of January 12, 2006

Claim 23 (original): The method of Claim 22, further comprising the step of:

varying non-rotating turbine component temperature in response to the proximity signal, to thereby vary the proximity of each of the turbine blades to the non-rotating turbine component.

Claim 24 (original): The method of Claim 21, further comprising:

detecting a peak value of the proximity signal amplitude variations, to thereby
determine a minimum turbine blade proximity to the non-rotating turbine
component.

Claim 25 (currently amended): A proximity sensor for sensing proximity of a rotating element to another element, comprising:

a sensor coil;

an oscillator circuit coupled to the sensor coil and operable to generate a variable frequency sensor signal and supply a the variable frequency sensor signal thereto, the variable frequency sensor signal generated by the oscillator circuit having a frequency that varies that is frequency modulated based on the proximity of the sensor coil to the rotating element, whereby the variable frequency sensor signal is a frequency modulated sensor signal;

a frequency modulation (FM) detector circuit adapted to receive the frequency modulated sensor signal and operable, in response thereto, to supply a proximity signal having an amplitude that varies with, and is representative of, the proximity of the rotating element to the other element.
